In the paper, cyclic volatile methyl siloxanes (cVMSs) were added to the CMAQ model to simulate the gas phase species. This dataset contains the edited CMAQ model code, run scripts, cVMS emission development, and hourly concentration and deposition fluxes of a subset of the modeled species.

Please contact the authors with questions or if you use the data. If you use the data, please cite both the ACP paper and this dataset.

At the time of data upload, the final ACP doi links have not been finalized. Below is the ACP Discussion citation to the article. The final ACP version should be available soon.
